- Data reporting
- General handover documentation
- Insights and recommendations
- Summary
- Appendix

# Introduction

In today's digital landscape, organizations like FinPro Bank process vast amounts of sensitive customer data, including personal information, account details, and transaction records.

**Effective data management** is not just a business necessity; it's a regulatory requirement. With the growing complexities of financial data, the bank must implement a robust framework.

# Purpose of the presentation

---

- Outline the project goals, scope, and significance of data-driven decision-making at FinPro Bank.
- Explain the methods used to collect and preprocess data, ensuring accuracy and reliability.
- Showcase the structured database implementation to support efficient data storage and retrieval.
- Discuss how data was analyzed to extract meaningful insights for business operations.
- Highlight the measures taken to protect sensitive data and ensure seamless integration across systems.
- Demonstrate the reporting framework that enables performance monitoring of key performance indicators (KPIs).
- Provide guidelines and documentation to ensure smooth transition and future maintainability.
- Present key findings and actionable steps to optimize FinPro Bank's data strategy for long-term growth.

# Summary of work done on the project

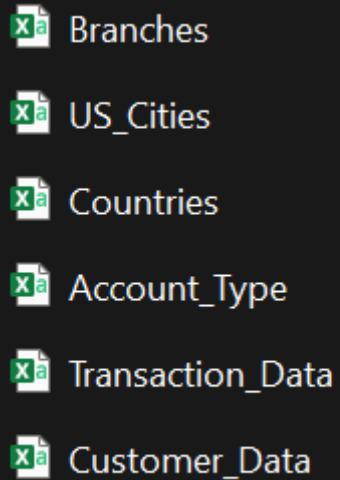

---

- **Cleaned data**
  - CSVs and Excel
- **Database design and setup**
  - OLTP and OLAP
  - SQL analysis
- **Evaluation and interpretation**
  - Excel reports
- **Data integrity and security**
  - Database privileges, RBAC
- **Data reporting**
  - Tableau dashboard
- **General handover documentation**
  - Strategy recommendations
- **Insights and recommendation**
  - Tableau Story

# **Data acquisition and cleaning**

1. Removing duplicates on IDs.
2. Filling null cells for column email to “email not provided”.
3. Transforming DOB and date related values
  1. Breaking down text to Month-Date-Year using Text to Columns data tools.
  2. Making date using formula “=DATE(year, month, day)”
4. Normalizing country names such as U.S, U.K, etc. to standardized country names in “countries” file data.
5. Transforming and normalizing columns (amount and balance) to numerical datatype
  1. Non numerical changed to 0.

# Data cleaning documentation (3 of 3)

**Balance Category**

=IF(J2>=10000; "High Balance"; IF(J2>=5000; "Medium Balance"; "Low Balance"))

**Balance Category**

=IFS(K2>=51; "51+"; K2>=36; "36-50"; K2>=26; "26-35"; K2>=18; "18-25")

# Analysis and visualization using MS Excel (1 of 3)

---

- KPI Metrics
  - Distribution of age group
  - Sum of balance by account type
  - Customer country
  - Count of transaction in a year
  - Average transaction amount in a year
  - Count of transaction type
- To achieve these KPI metrics visualization, using help of pivot table and then making pivot chart and configure its fields

# Analysis and visualization using MS Excel (2 of 3)

- Customer Age mainly from productive age and early retire (26-50)
- Sum of Balance for account type savings is much higher than checking
- Customer origin country mostly from the United States

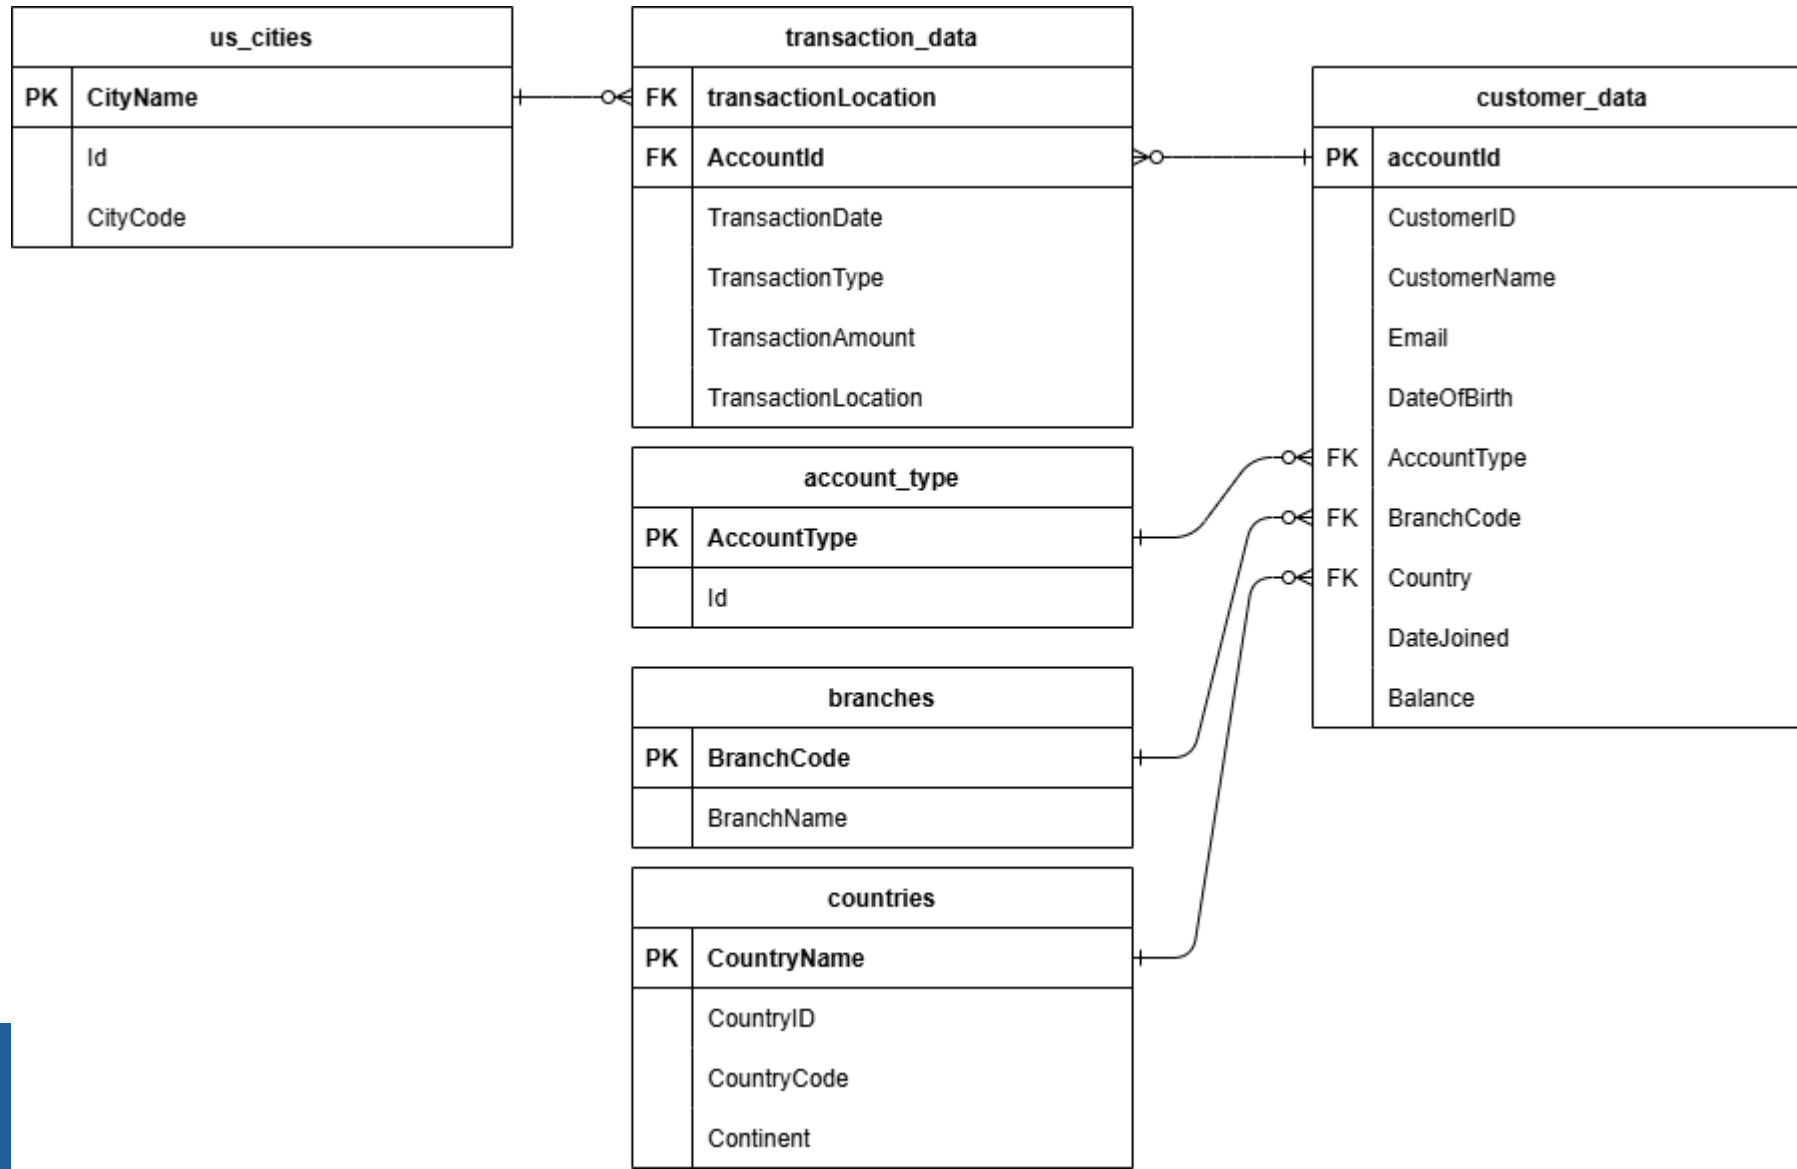

# Analysis and visualization using MS Excel (3 of 3)

- In 2022, the count of transactions was highest in April and lowest between August and December
- The total average transaction amount was highest in January, followed by a sharp decline in February. It then gradually increased until August before dropping again in September
- The most common transaction type is deposit.

# Database design and setup

# Entity relationship diagram (ERD) (1 of 3)

# Entity relationship diagram (ERD) (2 of 3)

---

- There are 6 entities for OLTP DB Schema
- Us\_cities
  - Has 3 attributes, with PK CityName
  - Related to transaction\_data (1 city has many transaction data 1-M)
- Transaction\_data
  - Has 6 attributes, with composite PK (TransactionLoc and AccountId)
  - Related to us\_cities (many transactions have 1 city M-1)
  - Related to customer data (many transactions have 1 account M-1)
- Customer\_data
  - Has 10 attributes, with PK accountId
  - Has 3 FK (AccountType, BranchCode, Country. Many to 1 relation)
- Account\_type
  - Has 2 attributes, with PK AccountType
- Branches
  - Has 2 attributes, with PK BranchCode
- Country
  - Has 4 attributes, with PK CountryName

# Entity relationship diagram (ERD) (3 of 3)

---

- Database design for OLTP system
- OLTP ensuring for high Create, Read, Update data
- A customer must have an account in a branch and a country.
- Every transaction must be linked to an existing account.
- Transactions affect the customer's balance.
- Valid account types must be assigned to customers.
- Branches, cities, and countries enforce geographical integrity.

# Table structure design

- Customer\_data
- Transaction\_data
- Branch
- accountType

Column Name	Data Type	Description
accountId	VARCHAR(255)	Unique identifier for each customer (Primary Key).
CustomerID	VARCHAR(50)	Customer's identification number.
CustomerName	VARCHAR(100)	Full name of the customer.
Email	VARCHAR(100)	Email address of the customer.
DateOfBirth	DATE	Customer's date of birth.
AccountType	VARCHAR(50)	Type of customer account (Foreign Key from <code>account_type</code> ).
BranchCode	VARCHAR(10)	Code of the branch where the account is registered (FK from <code>branches</code> ).
Country	VARCHAR(50)	Country of the customer (FK from <code>countries</code> ).
DateJoined	DATE	Date when the customer joined the bank.
Balance	DECIMAL(15,2)	Current balance of the customer.

Column Name	Data Type	Description
TransactionID	INT (Auto-Increment)	Unique identifier for each transaction (Primary Key).
AccountId	VARCHAR(255)	Associated customer account (Foreign Key from <code>customer_data</code> ).
TransactionDate	DATETIME	Date and time of the transaction.
TransactionType	VARCHAR(50)	Type of transaction (Deposit, Withdrawal, Transfer, etc.).
TransactionAmount	DECIMAL(15,2)	Amount involved in the transaction.
TransactionLocation	VARCHAR(100)	City where the transaction was made (Foreign Key from <code>us_cities</code> ).

Column Name	Data Type	Description
BranchCode	VARCHAR(10)	Unique identifier for each bank branch (Primary Key).
BranchName	VARCHAR(100)	Name of the branch.

Column Name	Data Type	Description
AccountType	VARCHAR(50)	Unique type of account (Primary Key).
Id	INT (Auto-Increment)	Internal reference ID.

# Table structure design

- Country
- US\_City

Column Name	Data Type	Description
CountryName	VARCHAR(100)	Name of the country (Primary Key).
CountryID	VARCHAR(10)	Unique identifier for the country.
CountryCode	VARCHAR(5)	ISO country code.
Continent	VARCHAR(50)	Continent where the country is located.

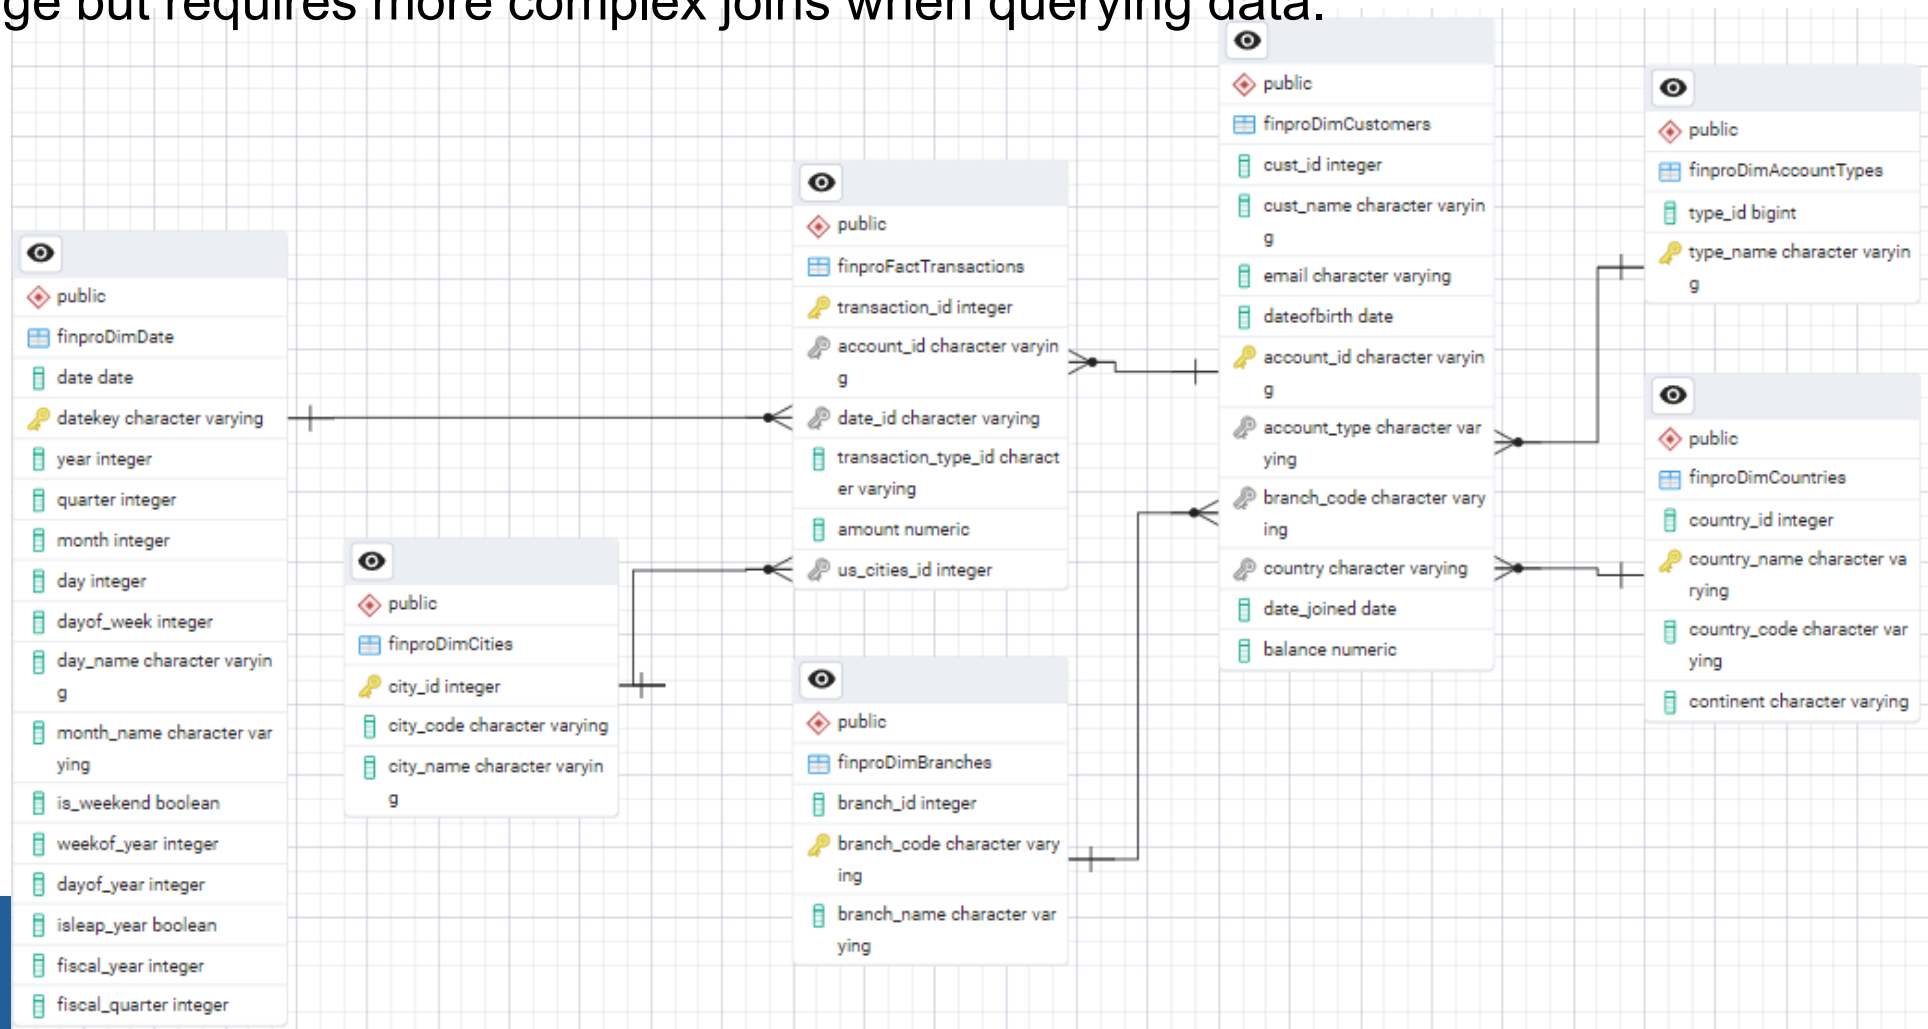

Column Name	Data Type	Description
CityName	VARCHAR(100)	Name of the city (Primary Key).
Id	INT (Auto-Increment)	Internal reference ID.
CityCode	VARCHAR(10)	Unique identifier for the city.

- Relationship

Relationship	Type	Description
customer_data ↔ transaction_data	1:M	One customer can have multiple transactions.
customer_data ↔ account_type	M:1	Many customers can have the same account type.
customer_data ↔ branches	M:1	Many customers belong to a single branch.
customer_data ↔ countries	M:1	Many customers belong to a single country.
transaction_data ↔ us_cities	M:1	Many transactions can occur in one city.

# OLAP schema (1 of 3)

- SNOWFLAKE SCHEMA
- dimension tables are further normalized into multiple related tables. This design optimizes storage but requires more complex joins when querying data.

# OLAP schema (2 of 3)

---

- There are 7 entities for OLAP DB Schema
- **DimDate**
  - Has 15 attributes, with PK dateKey
  - Related to DimTransactions (1 date has many transactions 1:M)
- **DimCities**
  - Has 3 attributes, with PK CityName
  - Related to transaction\_data (1 city has many transaction data 1-M)
- **Transactions**
  - Has 6 attributes, with PK transaction\_id
  - Related to DimCities (many transactions have 1 city M:1)
  - Related to DimCustomers-accountId (many transactions have 1 account M:1)
- **DimCustomers**
  - Has 10 attributes, with PK accountId
  - Has 3 FK (AccountType, BranchCode, Country. Many to 1 relation)
- **DimAccountTypes**
  - Has 2 attributes, with PK AccountType
- **DimBranches**
  - Has 2 attributes, with PK BranchCode
- **DimCountries**
  - Has 4 attributes, with PK CountryName

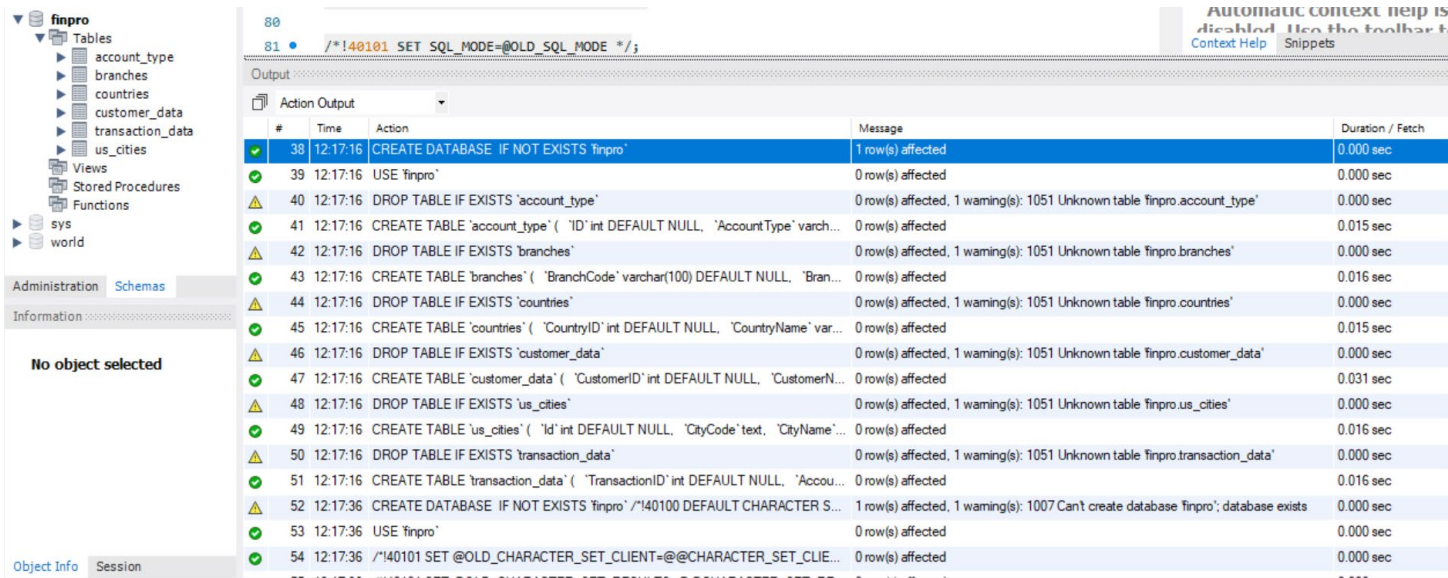

## OLAP schema (3 of 3)

---

- This Star Schema design is optimized for fast query performance analysis
- Business purpose
  - Trend Analysis: Find peak transaction months, customer behaviors.
  - Geographical Insights: Identify high-transaction locations.
  - Customer Segmentation: Analyze account types, balances.
  - Branch Performance: Track which branches generate more transactions.
  - Time-based Analysis: Compare yearly, monthly, or daily transactions.

# Evaluation and interpretation

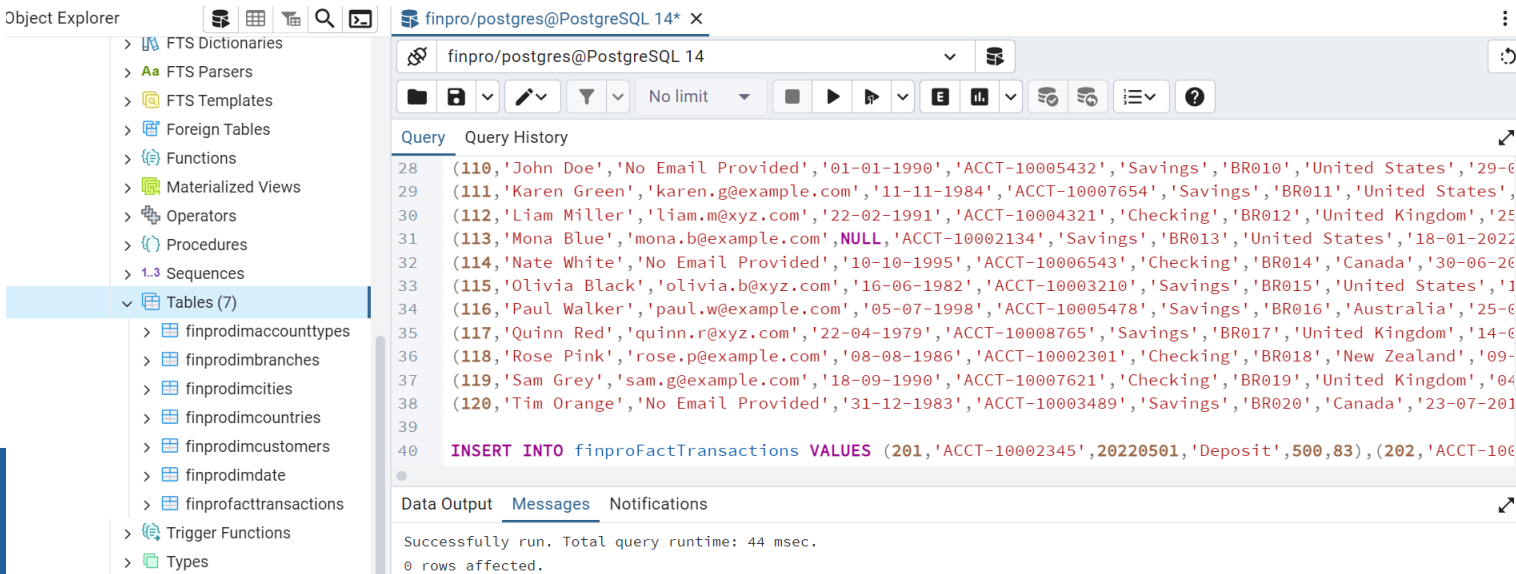

# Documenting SQL queries and scripts (1 of 4)

The screenshot shows the 'Output' window of SQL Enterprise Manager. The 'Action Output' tab is selected, displaying a log of SQL statements and their execution results. The log includes the following entries:

- Counts the number of deposits and withdrawals per customer.
- Uses CASE WHEN inside COUNT() to separately count deposits and withdrawals.
- LEFT JOIN ensures all customers are included, even those with no transactions.
- ORDER BY deposit\_count DESC, withdrawal\_count DESC sorts customers by most transactions.

# Inferences (1 of 2)

- **Inferences from OLTP**

- Insights from the Age Group ChartThe majority of respondents fall in the 26–35 and 36–50 age groups
- These two groups have the highest counts, suggesting that the survey or data source primarily involves middle-aged individuals.
  - Targeting new customers in 26–50 age range may be more effective.
  - Increase participation among older individuals might be needed.

- Insights from the Country Distribution Pie ChartThe
- United States has the highest representation (55%).This suggests that the dataset is heavily skewed towards U.S. respondents, making it the dominant demographic.
- Canada (20%) and the United Kingdom (15%) have moderate representation. These countries make up a significant portion of the data, meaning they can still provide valuable insights.
- If the focus is on the U.S. market, it may already be well-represented, allowing for targeted analysis.
- The low participation from Australia and New Zealand suggests that region-specific outreach efforts could be beneficial.

# Inferences (2 of 2)

- **Inferences from OLTP**
- **Overdrawn or Low-Balance Accounts Require Intervention**
  - The Closing Balance Per Account query revealed negative balances for some accounts
  - Actionable: Send alerts to these customers, offering repayment plans or overdraft protection.
- **High-Transaction Customers Are Key for Revenue Growth**
  - The Deposit & Withdrawal Counts Per Customer query shows top customers by transaction volume.
  - Actionable: Identify such high-engagement customers for premium banking services, exclusive offers, or priority support.

# **Data integration and security**

# Data integration recommendations (1 of 3)

---

- **areas requiring data integration**
- Customer Data Integration
  - Customer information is often scattered across multiple systems (e.g., core banking, CRM, mobile banking). Integrating customer data ensures a unified view of customers for better service, risk assessment, and personalized offerings.
- Transaction Data Synchronization
  - Real-time synchronization of transactions (deposits, withdrawals, transfers) between core banking, ATM networks, and digital banking platforms is necessary to maintain accuracy and prevent overdrafts or fraud.
- Fraud Detection & Risk Management
  - Fraud detection systems need access to real-time transaction feeds to flag suspicious activities instantly.
- Regulatory & Compliance Reporting
  - Banks must comply with financial regulations to ensure compliance.
- Business Intelligence & Analytics
  - A centralized data warehouse integrating customer, transaction, and operational data enables accurate KPI reporting and strategic decision-making

# Data integration recommendations (2 of 3)

---

- **Recommended Data Integration**

- ETL (Extract, Transform, Load) for Batch Processing
  - ETL ensures high-quality, structured data is available for BI reporting and analytics.
  - Extracting daily transactions from core banking and loading them into a data warehouse for financial reporting.
- API-Based Data Integration for Open Banking & Digital Services
  - RESTful and GraphQL APIs ensure secure, on-demand access to banking services
  - Ex. account balance checks and transactions
- Event-Driven Streaming
  - Real time data monitoring for Fraud detection systems in real-time
  - Ex. triggers an instant alert for potential fraud.

# Data integration recommendations (3 of 3)

---

- Real-time & Batch Processing Balance
  - The combination of ETL (for BI & reporting) and event-driven architecture (for fraud detection & live updates)
- API-First Approach for Open Banking
  - With the rise of fintech partnerships and mobile banking, API-based integration ensures secure customer interactions.
- Compliance & Security Prioritization
  - Integration regulatory systems ensures FinPro meets financial regulations.
- Scalability for Growth
  - Event-driven systems and data virtualization support future expansions without major infrastructure changes.

# Security documentation (1 of 3)

- Detailed setting RBAC

The screenshot shows the 'Add user account' form with the following fields and settings:

- Login Information:**
  - User name:
  - Host name:    - Password:  (with a strength indicator)
  - Re-type:
  - Authentication plugin:
  - Generate password:
- Database for user account:**
  - ☐ Create database with same name and grant all privileges.
  - ☐ Grant all privileges on wildcard name (username\\_%).
  - ☒ Grant all privileges on database finpro.
- Global privileges:**   
Note: MySQL privilege names are expressed in English.
  - Data:** ☒ SELECT, ☒ INSERT, ☒ UPDATE, ☐ DELETE
  - Structure:** ☐ CREATE, ☐ ALTER, ☐ INDEX, ☐ DROP, ☐ CREATE TEMPORARY TABLES, ☐ SHOW VIEW, ☐ CREATE ROUTINE, ☐ ALTER ROUTINE, ☐ EXECUTE, ☐ CREATE VIEW, ☐ EVENT, ☐ TRIGGER
  - Administration:** ☐ GRANT, ☐ SUPER, ☐ PROCESS, ☐ RELOAD

- Added new user “fin\_manager”
- Add global privileges for select, insert, and update
- For database level privileges, check select, insert, and update
- With these steps, fin\_Manager can only do selected privileges for finpro database.

The screenshot shows the 'Edit privileges' form for the user account 'fin\_manager'@'%' in the database 'finpro'. The 'Database-specific privileges' section is active, and the 'Check all' button is checked.

Note: MySQL privilege names are expressed in English.

- Data:** ☒ SELECT, ☒ INSERT, ☒ UPDATE, ☐ DELETE
- Structure:** ☐ CREATE, ☐ ALTER, ☐ INDEX, ☐ DROP, ☐ CREATE TEMPORARY TABLES, ☐ SHOW VIEW, ☐ CREATE ROUTINE, ☐ ALTER ROUTINE, ☐ EXECUTE, ☐ CREATE VIEW, ☐ EVENT, ☐ TRIGGER
- Administration:** ☐ GRANT, ☐ LOCK TABLES, ☐ REFERENCES

# Security documentation (2 of 3)

## • Detailed setting Encryption

```
7 • SET @key_str = SHA2('My secret passphrase', 512);
8 • ALTER TABLE customer_data MODIFY COLUMN AccountId varbinary(255);
9 • SET SQL_SAFE_UPDATES = 0;
10 • UPDATE customer_data SET AccountId = AES_ENCRYPT(AccountId , @key_str);
11
12 • SELECT *, cast(AES_DECRYPT(AccountId , @key_str) as char(255)) FROM customer_data;
```

Result Grid

# Data reporting

# Report specifications (1 of 6)

---

- Transaction data
  - Contains transactional records, including deposits, withdrawals.
  - Key for financial reporting, closing balance calculations, and fraud detection analysis.
- Customer data
  - Contains customer details such as name, age, country, account type, and joining date.
  - Essential for customer segmentation, age group analysis, and understanding customer demographics.
- Account type
  - Lists different types of bank accounts (e.g., savings, checking, credit).
  - Helps categorize transactions and analyze trends based on account type.
- Countries
  - Contains a list of countries where customers or transactions originate.
  - Used to segment data geographically for demographic insights and compliance reporting.
- Branches
  - Contains data about bank branches, such as branch codes, locations
  - Useful for analyzing branch performance, customer distribution, and transaction volume per branch.
- US\_Cities
  - Contains a list of cities
  - Helps in regional analysis of customer distribution, transaction trends, and branch locations.

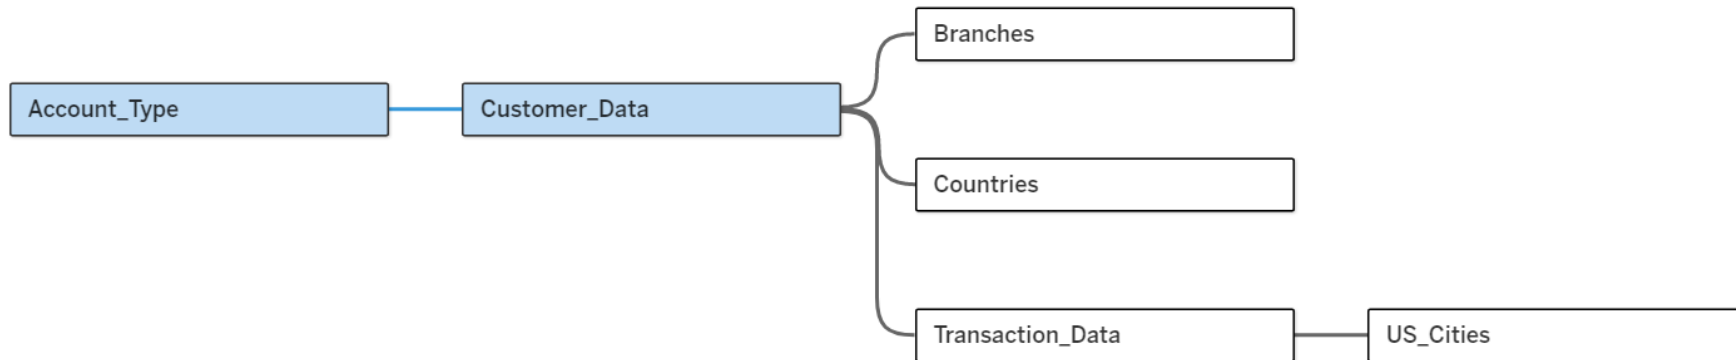

A vertical list of six data files, each preceded by a small green Excel icon. The files are: US\_Cities.csv, Branches.csv, Countries.csv, Account\_Type.csv, Customer\_Data.xlsx, and Transaction\_Data.xlsx.

-  US\_Cities.csv
-  Branches.csv
-  Countries.csv
-  Account\_Type.csv
-  Customer\_Data.xlsx
-  Transaction\_Data.xlsx

# Report specifications (2 of 6)

---

- Key filters
  - Account type - Helps categorize transactions and analyze trends based on account type.
  - Customer\_data - Essential for customer segmentation, understanding customer
  - Branches - Useful for analyzing branch performance
  - Countries - Used to segment data geographically by country
  - Transaction\_data - Key for financial reporting, customer behaviour
  - Us\_cities - Helps in regional analysis by cities
  - Closing Balance - final amount in each account after all transactions.
  - Age - Segments customers into age groups

# Report specifications (3 of 6)

The screenshot shows a Tableau interface with the following components:

- Columns:** Measure Names
- Rows:** Customer Name
- Filters:** Customer Name, Measure Names
- Marks:** Automatic (Text)
- Measure Values:** SUM(Balance), SUM(Closing Balance)

The report displays a table with the following data:

Customer Na..	Balance	Closing Balance
Alice Johnson	12,000	12,500
Bob Smith	3,000	2,800
Cathy Davis	8,500	8,800
David Lee	5,000	5,400
Eva Turner	-1,000	-550
Frank Zhang	7,500	7,400
Gina King	20,000	20,750
Harry Brown	3,500	3,300
Ivy Scott	8,000	8,600
John Doe	0	0
Karen Green	6,000	6,400
Liam Miller	5,500	5,400
Mona Blue	4,000	4,250
Nate White	10,000	11,000
Olivia Black	1,500	1,700
Paul Walker	-500	0
Quinn Red	23,000	23,800
Rose Pink	8,700	8,000
Sam Grey	500	850
Tim Orange	9,200	8,600

- This Closing Balance Report in Tableau provides an overview of customer balances, showing both their initial Balance and the Closing Balance after considering transactions.

## How to create report

1. New calculated measure for closing balance using formula  
[Balance] + CASE [Transaction Type]  
    WHEN 'Deposit' THEN [Transaction Amount]  
    ELSE -1 \* [Transaction Amount]  
END
2. Rows using customer name
3. Columns using measure names
4. Measure values using SUM balance and SUM closing balance
5. Marks using text for measure values

# Report specifications (4 of 6)

- This Branch Wise Closing Balance report in Tableau visualizes the Closing Balances of different branches

How to create report

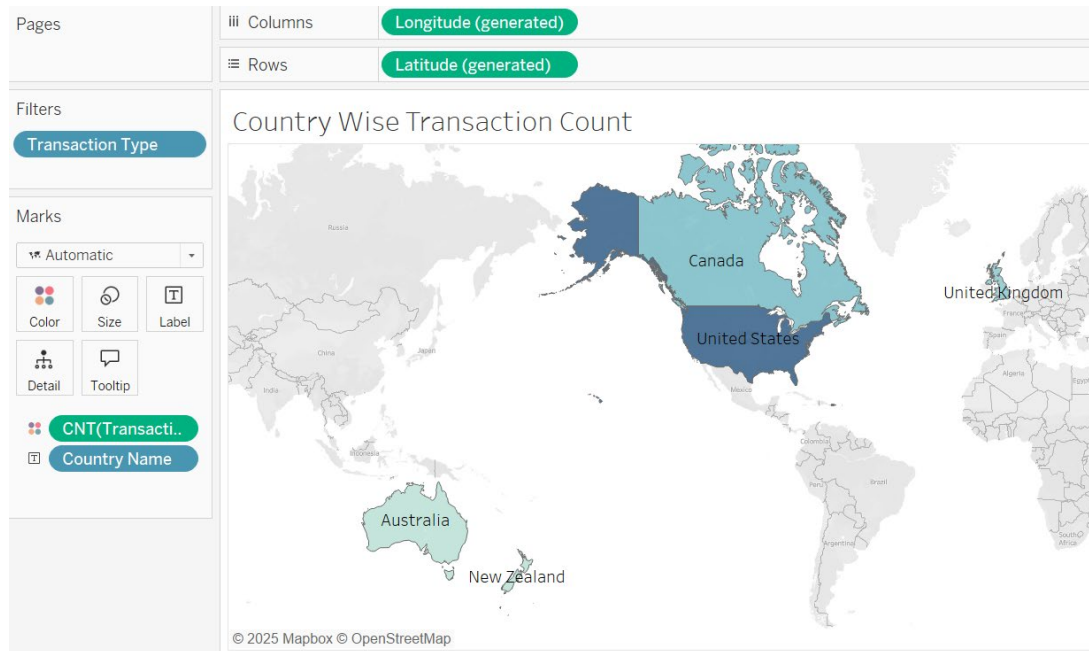

1. New calculated measure for closing balance using formula  
[Balance] + CASE [Transaction Type]  
    WHEN 'Deposit' THEN [Transaction Amount]  
    ELSE -1 \* [Transaction Amount]  
END
2. Rows using branch code and branch name
3. Columns using SUM of closing balance
4. Marks using color for closing values
5. Data label to make bar chart readable

# Report specifications (5 of 6)

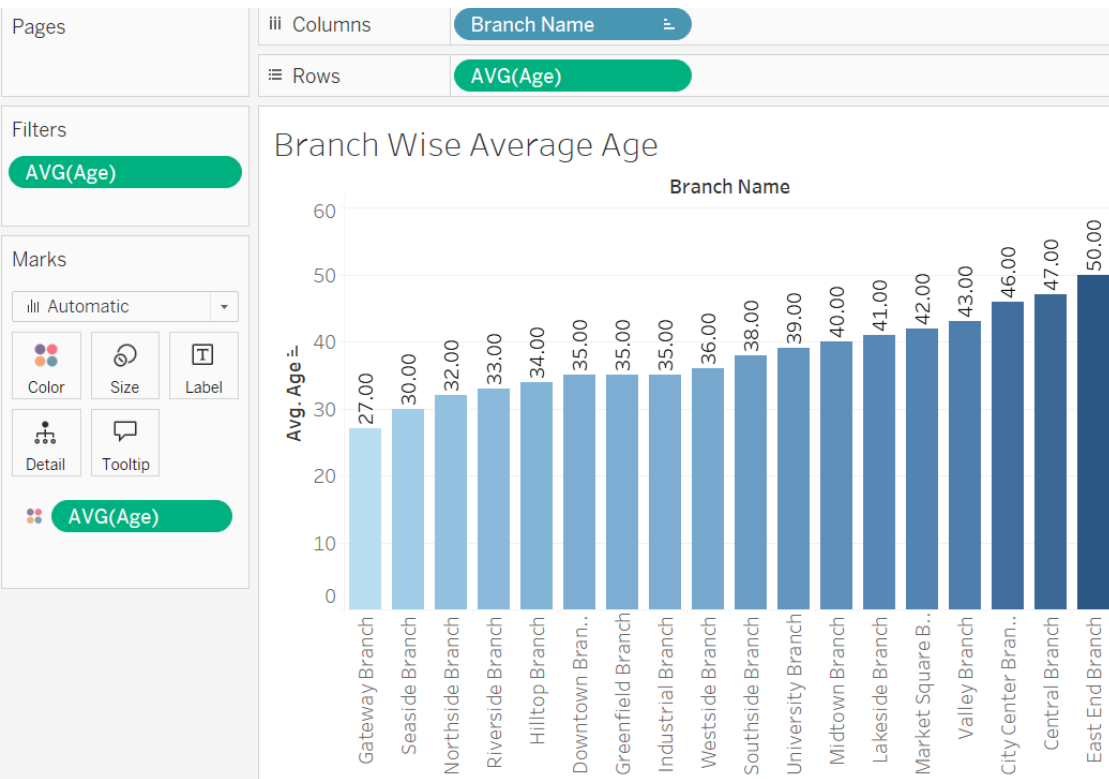

- This Tableau report visualizes the average age of customers across different branches, allowing businesses to analyze demographic distribution

## How to create report

- Columns and Rows using longitude and latitude (auto generated by tableau)
- Coloring country area by counting transactions occurred in a country
- Data label by country name to make map chart readable
- Filtered by transaction type to only show country with some transactions

# Report specifications (6 of 6)

- Country-Wise Transaction Count report in Tableau provides a geographical visualization of transaction volumes across different countries.

## How to create report

1. New calculated measure for AGE using formula  
`DATEDIFF('year', [Date Of Birth], TODAY())`
2. Columns using branch name
3. Rows using average of AGE
4. Marks using color to differentiate age average
5. Filters to only shows non null values

# Performance analysis guidelines (1 of 3)

---

- Customer wise Closing Balance
  - provides an overview of customer balances, showing both their initial Balance and the Closing Balance after considering transactions.
  - `[Balance] + CASE [Transaction Type] WHEN 'Deposit' THEN [Transaction Amount] ELSE -1 * [Transaction Amount] END`
- Branch Wise Closing Balance
  - visualizes the Closing Balances of different branches
  - `[Balance] + CASE [Transaction Type] WHEN 'Deposit' THEN [Transaction Amount] ELSE -1 * [Transaction Amount] END`
- Country Wise Transaction Count
  - provides a geographical visualization of transaction volumes across different countries.
  - Counting sum of transaction occurred in a country
- Branch wise average age
  - visualizes the average age of customers across different branches, allowing businesses to analyze demographic distribution
  - Counting average of age for each branch
- Average Transaction Value
  - Identifies spending patterns and pricing effectiveness.
  - Average of a transaction

# Performance analysis guidelines (2 of 3)

Branch Wise Average Age

## Design

- Chart Type: Bar Chart
- X-Axis (Category): Branch Name
- Y-Axis (Metric): Average Age
- Color Encoding: Gradient from light blue (lower) to dark blue (higher)
- Labels: Average Age

## Purpose

- To compare the average age of customers across different branches.
- Helps in demographic analysis for targeted marketing and customer service strategies.
- Assists in branch-level decision-making based on the customer base's age distribution.

## Insights

- Youngest customer base: Gateway Branch (Avg Age = 27) May require youth-oriented products/services.
- Oldest customer base: East End Branch (Avg Age = 50) Likely serves older customers who may have different preferences.
- General Trend: Age increases across branches, suggesting regional or operational differences in customer demographics.
- Strategic Use:
  - Tailor marketing campaigns based on age preferences.
  - Adjust product offerings to match demographic needs.
  - Optimize customer service approaches for different age groups.

# Performance analysis guidelines (3 of 3)

---

- **MAINTENANCE**

## **Refreshing Data:**

1. **Automate Data Extraction** from sources (SQL, Excel, Cloud).
2. **Schedule Refresh** (daily, weekly) to keep insights up to date.
3. **Validate Data Accuracy** using consistency checks (duplicate removal, missing values).

## **Adding/Removing KPIs:**

1. **Assess Business Needs** – Ensure relevance of new KPIs.
2. **Modify Calculated Fields** in Tableau for new formulas.
3. **Update Dashboard Layout** – Adjust visual elements to fit new KPIs.
4. **Test & Validate Changes** – Check if filters and interactivity work as expected.

## **Performance Optimization:**

1. **Optimize Data Sources** – Use extracts instead of live connections where possible.
2. **Reduce Unnecessary Calculations** – Precompute KPIs at the database level.
3. **Limit Filters & Aggregations** – Too many dynamic filters slow down performance.
4. **Use Indexed Columns** – faster query execution.

# **General handover documentation**

# Role and key responsibilities

---

- **Data Owners**

Data Owners are responsible for managing the entire data lifecycle, ensuring compliance with governance policies, and addressing any quality or security issues within their datasets. They have overall accountability for data integrity and are central to decision-making regarding data access and usage.

- **Data Stewards**

Data Stewards are the custodians of data quality, responsible for ensuring that all data complies with organizational standards. They regularly monitor data accuracy and completeness, working alongside Data Owners to resolve any quality issues.

- **Compliance Officers**

Compliance Officers ensure that SecureHealth adheres to all relevant regulations, including GDPR and HIPAA. They conduct regular audits, manage data subject requests, and ensure that privacy policies are consistently applied across all processes.

- **IT Security Team**

The IT Security Team implements technical security measures such as encryption, access control, and network protection. They collaborate with other roles to ensure that all security practices align with both internal policies and external regulations.

- **Data Governance Committee**

The Data Governance Committee is responsible for overseeing the entire governance strategy. They ensure that governance policies align with the organization's goals, conduct periodic reviews, and guide Data Owners and Compliance Officers.

# System architecture diagram

---

- Data sources/ operational systems save data into their own OLTP storage.
  - Excel, CSV., etc
  - OLTP using MySQL, PostgreSQL, etc
- Many OLTP storage will be extracted and going to Extract and load phase, then normalized data will be loaded into OLAP database.
  - ETL using talend, Pentaho, apache airflow, etc
  - OLAP using PostgreSQL, DB2, Amazon Redshift, Snowflake, etc
- OLAP databases will be used for analysis using BI tools
  - Tableau, PowerBI, Metabase, Google looker, etc

# Key challenges and resolutions

---

- Data Cleaning Issues (Nulls, Duplicates, Formatting) - Using simple but effectively formatting tools (excel, python)
- Ensuring Data Integrity Between OLTP and OLAP - Used checksum validation and logging mechanisms during ETL.
- Integration various data sources – data extraction and phase transformation for individual sources

# **Insights and recommendations**

# Insights and recommendations

---

- Ensure Data Quality & Consistency
  - Implement data validation rules to check for missing, duplicate, or incorrect entries before loading data into OLAP. Standardize naming conventions across datasets (e.g., product categories, date formats, customer IDs). Perform regular audits to maintain data integrity.
- Improve Dashboard Performance & User Experience
  - Use aggregated tables or materialized views to store precomputed results
  - Convert live connections to extracts when possible to reduce query execution time.
  - Implement filters and parameters to allow users to focus on relevant data instead of loading everything at once.
